A Few Words About Fog Sealing:

Fog sealing will occur after chip sealing has been completed and the roadway has been swept clean. The purpose of fog sealing is to reduce the amount of rock that may be dislodged from the chip seal application; reduce dust from chip sealing; and improve the wear life of the roadway. The surface will appear black and the subsequent road striping will have more contrast than without fog sealing. Please be patient with our crews as we move through the chip sealing process. The roads will soon look like the fog sealed lane on the right hand side rather than the chip seal-only, left hand lane.
